Abstract:
In this document an envisioned scenario is described that illustrates the future of mobility using revolutionary technologies currently in development. The comprehensive CPS scenario spans over the relevant mobility domains (automotive, railway, avionics) such that, on the one hand, for each of these domains tie points can be found to their own specific scenarios and, on the other, cross-domain topics of interest permit the analysis of interaction and mutual interference possibly arising between domain-specific scenarios as well as the analysis of the interplay the domain-specific scenarios with the global, cross-domain scenario.
