Technical University of Munich School of Engineering and Design Department of Mobility Systems Engineering Chair of Traffic Engineering and Control

Revisiting Urban Traffic Control in Austria, Germany and Switzerland -**Requirements for Future Developments**

Mario Ilic, Natalie Sautter, Martin Margreiter, Allister Loder, Klaus Bogenberger

Technical University of Munich

In a Nutshell

- representatives of German and Swiss Austrian cities' traffic control authorities between April and July 2021
- We determined the status quo of traffic control (system, strategies, spatial levels) in the surveyed cities
- We revealed that adaptive network control systems are not popular and identified the reasons for that
- We found that cities wish for **multimodal** traffic controls in the future, but expect many challenges in implementation
- We enquired the **potential of AI** for urban traffic control
- We derived requirements for future urban traffic control

Acknowledgements

This work has been carried out as part of the KIVI research project (Artificial Intelligence in the Transportation System of Ingolstadt), which is funded by the German Federal Ministry of Transport and Digital Infrastructure (Funding ID: 45KI05A011).

City Sample

Geographical Location of the Interviewed Cities

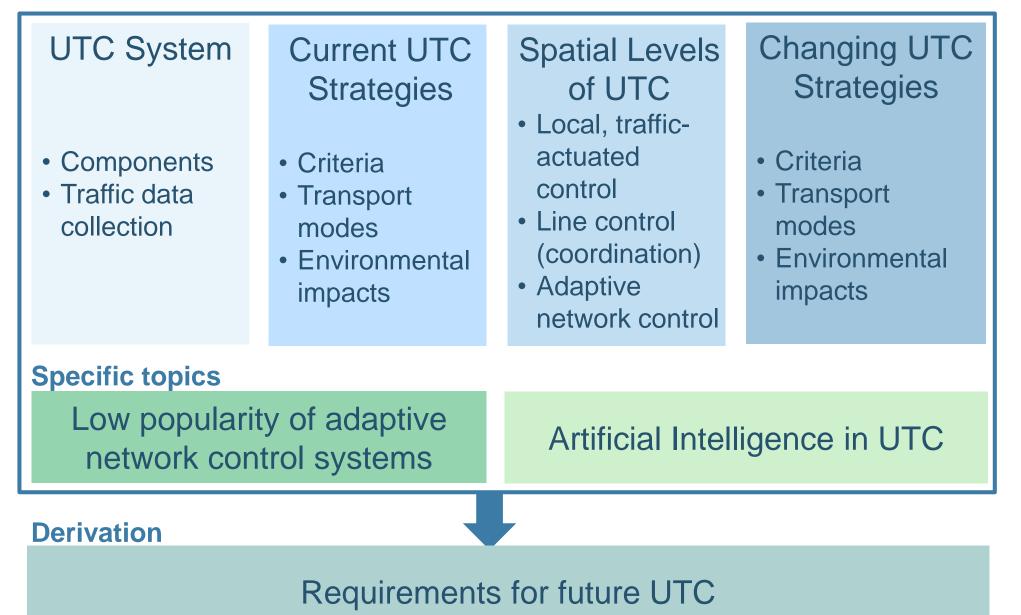

Statistical Data of the Interviewed Cities

• Cities have structural differences (see statistical data) • Cities face different challenges: different traffic demands, financial resources, regulatory responsibilities and municipal political circumstances

	137.000	1.911.000
Population	0 - ×	2 Mio. inh.
Area	24 0	755 • 1.000 km ²
Population density	1.030 0 × 2.660	8.210 10.000 inh. / km ²
Level of motorization	330 0 • • • • • • • • • • • • • • • • • •	840 • 1.000 veh. / 1.000 inh.
Motorized private transport in modal split	$\begin{array}{c c} 21 & 59 \\ \hline \\ \hline \\ 35 \\ \end{array}$	100%
Public transport	$\begin{array}{c c} & 7 & & 38 \\ \hline & & & & \\ \hline & & & & \\ \hline & & & & \\ \hline & & & &$	100%
Cycling in modal split	$ \begin{array}{c c} & 7 & 39 \\ \hline 0 & - & - & - & - \\ 0 & & 18 \end{array} $	100%
Walking 000000000000000000000000000000000000		100%

Survey Elements

Results

Dependency between Traffic Signal Number and City's Population Size

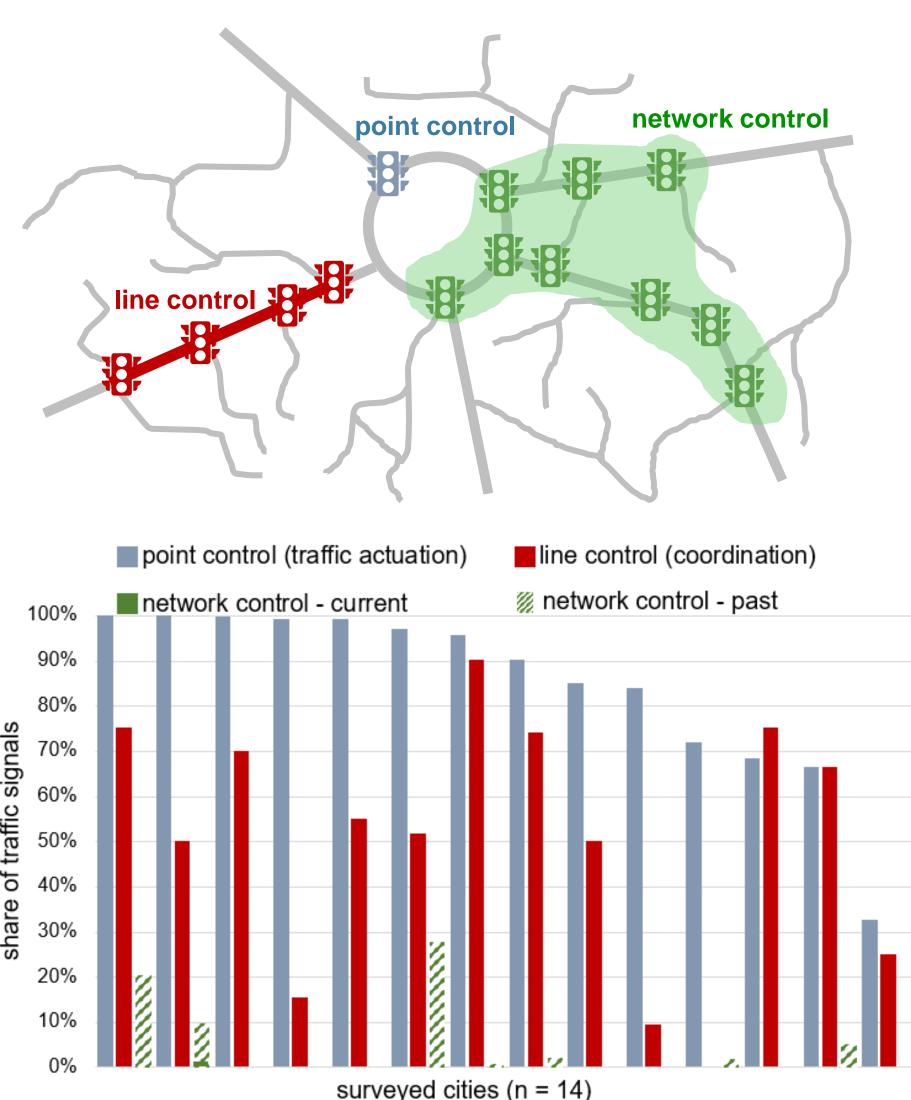

Potential of Artificial Intelligence in Urban Traffic Control

- Rather in the handling of big data for traffic state estimation and prediction than in the traffic control task itself
- Improvement expected for data fusion (data of different types and from different detectors)

*UTC: Urban Traffic Control

Spatial Levels of Urban Traffic Control

- Local traffic-actuated control is widely implemented: at 85% of traffic signals on average
- Coordination is widely used: at 53% of traffic signals on average
- Commercially available, adaptive network control systems (e.g. MOTION, BALANCE) are rare: 7 out of 14 cities applied adaptive network control around the 2000s, but switched them off in the past years
- Prioritization of public transport has been promoted for decades and is now widespread

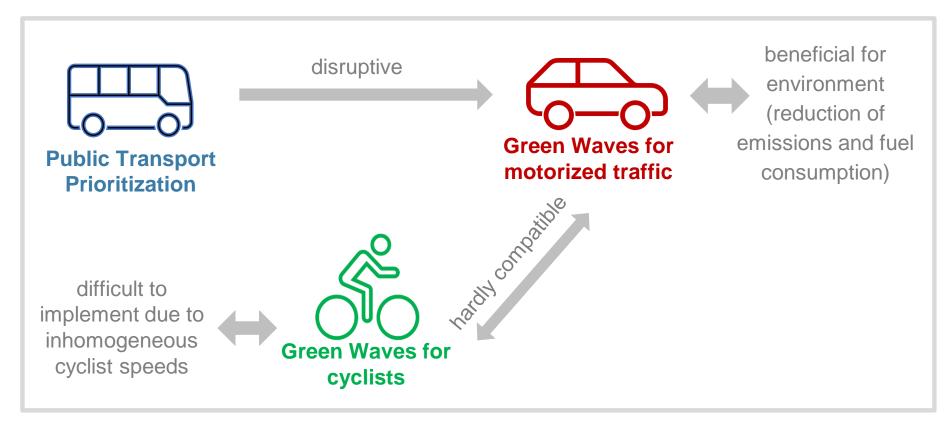

Reasons for the Low Popularity of Adaptive Network Control Systems

- Intransparency
- Low cost-benefit ratio
- Frequent switching traffic control operations
- Strong focus on motorized private transport

TRBAM-22-04448 2022-01-11

Current Challenges in Urban Traffic Control

Requirements for Future Urban Traffic Control

Requirements	Implementation
1. Integrated (network) control	Traffic management + signal control measures
2. Transparency and inclusion of a city's expertise	Measure and spots identification in cooperation with the city
3. Multimodality	Temporal and spatial differentiation in network control
4. Improved traffic state estimation and prediction	Spots identification for pre- warning, AI based methods for data processing

Conclusion

- Political reorientation from car-oriented urban transport planning to a promotion of cycling and walking (multimodality)
- Local traffic-actuated control, coordination and public transport prioritization are widespread
- Adaptive network control systems were switched off in the past years or were not even considered for implementation
- A revival of network control systems requires a wider scope, transparency, multimodality and an improved traffic state estimation and prediction
