Titel des Beitrags: New Organizational Forms and IT
Abstract: The availability of powerful IT/IS is perceived as a driving force as well as a necessary prerequisite for new organizational solutions. However, even though the close interrelatedness of organizational structure and IT/IS has been widely recognized for a long time, a thorough understanding of their linkage is still missing. The research project NOF (New Organizational Forms) aims at closing the gap between the organizational and IS discipline in order to further the understanding and provide insights for future systems development. During the first phase of the project, a structured approach for researching new organizational forms was developed which distinguishes the two dimensions intraorganizational dispersion and interorganizational governance. The second phase, comprising theoretical considerations and case study work, will result in an interdisciplinary research framework as a first step towards a theory of new IT-enabled organizational forms. During the last phase of the project first reference models for new organizational forms will be developed and it will be...
evaluated whether the existing modeling techniques are sufficient to model the new organizational forms.
