Abstract:

A focus of many business curricula is on information management including special topics such as Data Warehousing. In real life system architects usually encounter the question of how to design a Data Warehouse to meet certain business requirements. The different approaches and the related challenges of Data Warehouse design will be addressed in theory and within the scope of a concrete case study. The case study offers a hands-on-scenario illustrating the implementation of a data model for sales reporting. The widespread Data Warehouse solution SAP Netweaver BI 7.0 is used as technological platform.
