
The perioperative treatment of muscle-invasive bladder cancer has become a standard procedure in recent years. New agents, such as programmed cell death protein 1 (PD1) and PD1-ligand 1 (PD1-L1) inhibitors have opened up the door for immunomodulation therapy of metastasized bladder cancer. This article focuses on data which have changed or have the potential to change the pharmaceutical treatment of advanced bladder cancer with a review of the literature in Medline PubMed and proceedings of major meetings, e.g. the European Association of Urology (EAU), the American Society of Clinical Oncology (ASCO), the ASCO Genitourinary Cancers Symposium (ASCO GU) and the American Urological Association (AUA).
